2. Really independent sets. Given a graph G=(V,E), say that a subset  $S\subseteq V$  is really independent if there are no  $u,v\in S$  that are two or fewer steps apart in the graph, that is, for all  $u,v\in S$ , the length of the shortest path between u and v is at least 3. The problem REALLY INDEPENDENT SET takes a graph G and an integer k as input, and asks if G has a really independent set of size k or more. Prove that this problem is NP-complete.

Per democtrai que es DP nonés tema que comprarar que donat un testemani ens pugui ativamen que el problèma os really andependent set o no. Donat en grat G= (U, E):

Un relly andependent set S=V, loque tenem sora comprehen Vo, v ∈ S, el camí més curt entre p n n sigui Com a minum 3.
